

Severe weather weighs on U.S. retail sales and some industrial production

KEY TAKEAWAYS

- U.S. retail sales drop more than expected, partly due to adverse weather. Underlying trend still solid.
- Strong utilities output supports U.S. industrial production, as cold weather weighs on manufacturing and mining.
- U.S. business inventories decline at yearend, but level still near balanced with demand.
- U.S. import prices rise less than expected, reflecting dollar strength.
- Eurozone GDP revised up, green shoots ahead.
- China's lending surges, but overall credit still weak.

U.S. retail sales tumble, due to weather disruption

Retail sales tumbled a bigger-than-expected 0.9% in January, down for the first time in five months, and by the most since March 2023. Some pullback was to be expected, given the surge in spending in Q4. But the January decline was exacerbated by severe winter weather in large parts of the country and wildfires in California. Such temporary disruptions are typically followed by a rebound in sales in subsequent months.

Vehicle sales, which account for about a fifth of retail sales, fell 2.8%. This mostly reflected fewer units sold, as new vehicle prices were unchanged from the prior month while used car and truck prices rose. Retail sales ex-vehicles fell 0.4%, contrary to the consensus of a modest increase, as most major categories declined.

Our measure of discretionary retail sales and its core, which is close to the control group used in the GDP estimate, fell 1.2% and 1.1%, respectively.

Biggest drop in retail sales since March 2023

E0141

On a y/y trend basis, however, retail sales maintained strong momentum, up 4.2%, the most in nearly two years. Discretionary and core discretionary retail sales also rose at solid rates, up 4.9% and 4.5%, respectively. The underlying consumer resilience is supported by a healthy labor market, with low unemployment and elevated wage growth.

We expect to see some moderation in consumer spending this year amid more tepid real income growth than last year, a smaller wealth effect, and some pickup in delinquency rates, especially on credit card debt.

Growth from a year ago still strong

E142C

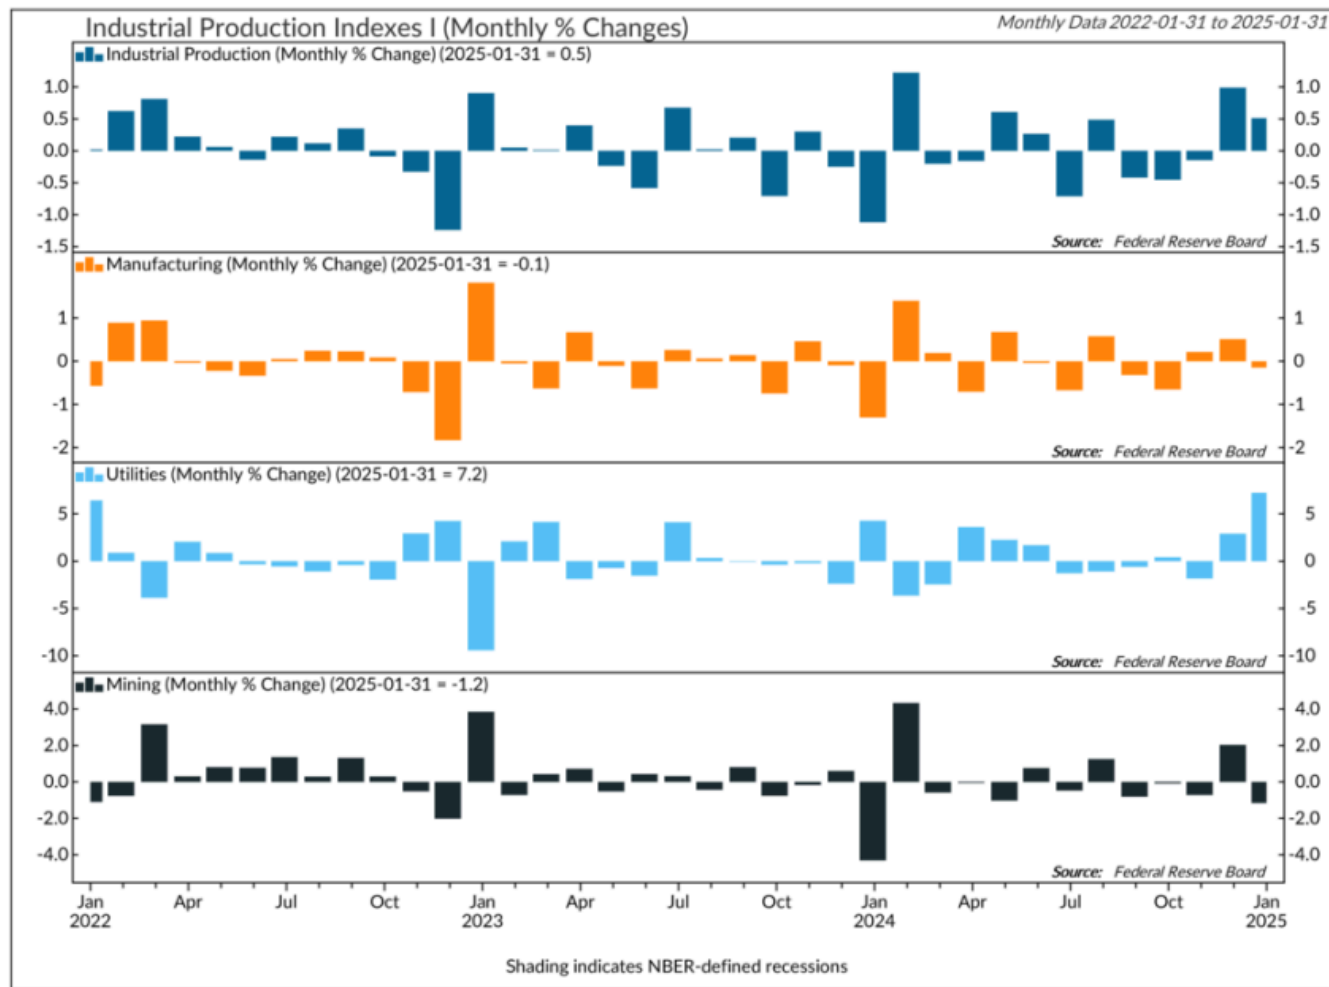

U.S. industrial production up, led by utility output

Industrial production rose a bigger-than-expected 0.5% in January, as utilities output jumped due to much colder-than-normal weather. Partly for the same reason, mining and manufacturing output fell from the prior month.

Utilities and energy output drove industrial production in January

Total energy output, which includes consumer and commercial products, converted fuel, primary energy, as well as oil and gas well drilling, and accounts for about a quarter of industrial production, increased 2.5% at the start of this year. Excluding energy, industrial production was down 0.3%.

In manufacturing, durable goods output was flat. A surge in aerospace and miscellaneous transportation equipment, due to production catchup after the Boeing strike last year, was offset by a decline in vehicles output. Nondurable goods manufacturing fell slightly from the prior month.

On a y/y basis, industrial production was up 2.0%, the most since October 2022. A jump in ISM manufacturing new orders in January amid a continued rundown in inventories bodes well for continued production growth in the near-term.

ISM indicator points to continued production growth

The capacity utilization rate picked up to a slightly higher-than-expected 77.8%. This, however, is still 1.8 ppt below its long-term average, which implies some excess capacity and disinflationary pressures stemming from it.

Even so, our Inflation Timing Model, which is a composite of 21 indicators (including capacity utilization), rebounded two points to +1 in January, climbing back into modest positive territory. The latest reading is consistent with neutral pressure on inflation, after signaling disinflation for most of the time since mid-2022.

U.S. business inventories decline

Business inventories fell 0.2% in December, down for the first time in ten months, and contrary to expectations of a pickup. A substantial decline in wholesale and retail inventories was only partially offset by an increase in manufacturing inventories.

Strong sales drive down inventories at yearend

The decline in inventories came alongside a 0.8% increase in business sales. As a result, the I/S ratio dipped to 1.35 from 1.37 in the prior month, matching its lowest level since mid-2022. Notably, the retail I/S ratio slipped to 1.30, slightly below its 12-month average. It still indicates near balance of supply and demand, but further erosion would signal building inflationary pressures in goods prices.

E705C

U.S. import prices rise less than expected

Import prices rose a smaller-than-expected 0.3% in January, with fuel and nonfuel prices up 1.2% and 0.1% respectively. On a y/y basis, import prices eased slightly to 1.9%, and were down-to-flat across key trading regions, reflecting U.S. dollar strength.

Import price data reflects the dollar price paid by U.S. importers, and does not include tariffs. Amid rising U.S. tariffs and tariff threats, their passthrough to inflation depends on the U.S. dollar, as discussed in the **U.S. Focus** yesterday. A stronger dollar could offset the tariffs, while a flat-to-weaker dollar would allow for some passthrough to inflation.

Import price inflation remains low

Eurozone GDP revised up, green shoots ahead

The eurozone’s real GDP expanded 0.1% in Q4 of last year, exceeding its initial estimate for a flat reading. But trends varied widely by economy. Among the countries that have reported Q4 data, Germany and France contracted, Italy was flat, while Spain, Portugal, and the Netherlands grew at strong rates.

Eurozone GDP growth varied widely by economy

ICS_201.RPT

For the year, the region eked out a gain of just 0.7%, below pre-pandemic growth rates and partly a reflection of weak potential real GDP growth. We anticipate a modest acceleration of 1.1% this year, due in part to easier monetary policy. Indeed, the PMIs for January, which saw the composite rebound back into expansion territory, indicate some green shoots in the region. Our recession probability model has also been trending lower. However, downside risks emanating from possible U.S. tariffs, lack of competitiveness in the manufacturing sector, and domestic political issues persist.

NDR Eurozone Recession Probability Model edging lower

IE1090

China’s lending surges, but overall credit still weak

New total social lending, China’s broadest measure of lending, surged to a record in January. Seasonally, lending is strongest in January because of a reset of quotas. Even so, the reading beat all past Januarys. New bank lending, a subset of total social lending, also rose to a record. While this surge may be a reflection of easier monetary policy and government stimulus, total outstanding credit remains historically depressed. Indeed, the year-to-year change in both social lending and bank loans are either at or close to their slowest paces on record.

Chinese lending surges to a record, reflecting seasonal jump

Founded in 1980, NDR (Ned Davis Research) is a leading independent research firm with clients around the globe. With a range of products and services, we deliver award-winning solutions to the world's leading investment management companies. Our clients include professionals from global investment firms, banks, insurance companies, mutual funds, hedge funds, pension and endowment funds, and registered investment advisors. NDR uses the weight of the evidence, a 360-degree approach, to frame our market insights. Evidence, data that has been continually amassed over decades, shapes historical perspective and allows us to build proprietary indicators and models. We use this methodology to help our clients make objective investment decisions.

Important Information and Disclaimers

NDR's reports reflect opinions of our analysts as of the date of each report, and they will not necessarily be updated as views or information change. All opinions expressed therein are subject to change without notice, and you should always obtain current information and perform due diligence before trading. NDR or its affiliated companies or their respective shareholders, directors, officers and/or employees, may have long or short positions in the securities discussed in NDR's publications and may purchase or sell such securities without notice.

NDR uses and has historically used various methods to evaluate investments which may, at times, produce contradictory recommendations with respect to the same securities. When evaluating the results of prior NDR recommendations or NDR performance rankings, one should also consider that **NDR may modify the methods it uses to evaluate investment opportunities from time to time, that model results do not impute or show the compounded adverse effect of transaction costs or management fees or reflect actual investment results, that other less successful recommendations made by NDR are not included with these model performance reports, that some model results do not reflect actual historical recommendations, and that investment models are necessarily constructed with the benefit of hindsight. Unless specifically noted on a chart, report, or other device, all performance measures are purely hypothetical, and are the results of back-tested methodologies using data and analysis over time periods that pre-dated the creation of the analysis and do not reflect tax consequences, execution, commissions, and other trading costs. For these and for many other reasons, the performance of NDR's past recommendations and model results are not a guarantee of future results.**

Using any graph, chart, formula, model, or other device to assist in deciding which securities to trade or when to trade them presents many difficulties and their effectiveness has significant limitations, including that prior patterns may not repeat themselves continuously or on any particular occasion. In addition, market participants using such devices can impact the market in a way that changes the effectiveness of such devices. NDR believes no individual graph, chart, formula, model, or other device should be used as the sole basis for any investment decision and suggests that all market participants consider differing viewpoints and use a weight of the evidence approach that fits their investment needs. Any particular piece of content or commentary may or may not be representative of the NDR House View, and may not align with any of the other content or commentary that is provided in the service. Performance measures on any chart or report are not intended to represent the performance of an investment account or portfolio, as some formulas or models may have superior or inferior results over differing time periods based upon macro-economic or investment market regimes. NDR generally provides a full history of a formula or model's hypothetical performance, which often reflects an "all in" investment of the represented market or security during "buy", "bullish", or similar recommendations. This approach is not indicative of the intended usage of the recommendation in a client's portfolio, and for this reason NDR does not typically display returns as would be commonly stated when reporting portfolio performance. Clients seeking the usage of any NDR content in a simulated portfolio back-test should contact their account representative to discuss testing that NDR can perform using the client's specific risk tolerances, fees, and other constraints.

NDR's reports are not intended to be the primary basis for investment decisions and are not designed to meet the particular investment needs or suitability of any particular investment for any particular investor. The reports do not address the tax consequences of securities, investments, or strategies, and investors should consult their tax advisors before making investment decisions. Investors should seek professional advice before making investment decisions. The reports are not an offer or the solicitation of an offer to buy or to sell a security.
